

Device for diverting intestinal contents from loop colostomy consists of a bag for collecting intestinal contents with an inlet opening for fecal matter on its wall and an adhesive plate on the side wall for securing it to the skin. In the lower part of the bag there is an outlet for fecal matter with a clamp. Wherein, the inlet opening for fecal matter is designed as a neck with a conical sleeve, to which an elastic sleeve is attached via a conical tip for suturing to the exteriorized intestine.
