

Method for obtaining zinc {bis(hydroxyethylenediaminetetraacetato)germanate(IV)} to increase yield of winter wheat involves carrying out stepwise synthesis, first of ethylenediaminetetraacetate hydroxygermanic acid by reacting an equimolar amount of 0.005 mol of GeO_2 powder and ethylenediaminetetraacetic acid (H_4 EDTA), and then adding aqueous solution of zinc acetate in an amount of 0.0025 mol.
