

Method for preparing pharmaceutical composition for the treatment and prevention of parasitic infections in animals comprises mixing an isoxazoline compound with a pharmaceutically acceptable carrier containing a polysorbate surfactant and diethylene glycol monoethyl ether. During the mixing process, dry sunflower lecithin with a phospholipid content of at least 98% is additionally introduced in an amount of 0.2–0.35% of the total mass of the resulting composition. Wherein, the components are sequentially added with stirring until a homogeneous concentrated solution is obtained.
