

Soft thermal stretchers for transporting injured contain a rectangular sheet with carrying handles and fixing elements. Wherein, they additionally include at least four functional layers, the first layer is designed as a base made of flexible wear-resistant material with carrying handles located along the wider sides of the sheet and at least two straps for securing the injured, the second layer is designed as a heat-insulating lining made of soft insulating material, positioned above the first layer, the third layer is designed as a heat-retaining blanket made of a thermoreflective material that reflects the thermal radiation of the injured body and helps reduce heat loss during transportation, and the fourth layer is designed as a waterproof outer cover capable of protecting the casualty and the entire structure from precipitation.
