

Wire fan-shaped rakes consist of wire tines, a wire tine holder, and a fastening element with a handle. The wire tines are made of stainless steel wire, have ends bent in an L-shape at a calculated angle, which provides a right angle with the contact surface, taking into account the angle of the handle during individual use by a person, and are fastened to the holder in the form of a base and a crossbar-stiffener with their straight ends. Wherein, the fan includes at least 8 wire tines, and the fastening element with the handle is made in the form of a sleeve, circular in cross-section, fastened to the base and the adjacent wire tines of the fan, which has a hole for fastening and fixing the handle.
