

Device for treating foraging bees with liquid veterinary preparations, featuring a humidification system. The humidification system is a plate of dense foam rubber 140×80×30 mm with a 100×8 mm bee entrance slot in its lower third, which fits into a 145×85×35 mm plastic case comprising two parts, each with 100×8 mm slots, has two holes with a diameter of 5 mm for periodic saturation with a liquid veterinary preparation and is secured with double-sided adhesive tape in front of the bee entrance on the outside of the hive. A wooden fuse with a diameter of 8 mm and a length of 40 mm is inserted in the center of the foam rubber and case slots to prevent the bee entrance slot from sticking together.
