

Method for producing a medicine in the form of capsules based on ionized 3,3',4',5,7-pentahydroxyflavone with antimicrobial action against resistant and test strains of bacteria, fungi involves the preparation of the dosage form. Wherein, 3,3',4',5,7-pentahydroxyflavone and arginine are individually cryo-ground, then frozen with liquid nitrogen vapor; 3,3',4',5,7-pentahydroxyflavone and arginine are jointly cryo-ground to form water-soluble ionized 3,3',4',5,7-pentahydroxyflavone in a molar ratio of 1:3–1:5 in a cryomill, then the capsule is filled and obtained.
