

Parchment mold for thermal processing of food products consists of an oval-shaped blank made of food paper and fasteners for securing its edges. The blank is made of heat-resistant food parchment with the possibility of folding into a boat-shaped form with the formation of a rectangular bottom and raised sides. The fasteners are made in the form of food plastic clamps installed with the possibility of covering and pressing the folded edges of the parchment to stabilize the shape and hermetically retain the liquid during thermal processing of food.
