

Expendable trailer consists of a bottom, a frontboard, sideboards and a tailboard. Wherein, sideboards consist of a front section, an expendable middle section, a fixed middle section and a hinged tail section. The front section of the sideboards is rigidly attached to the front section of the frame; the fixed middle section of the sideboards is rigidly attached to the fixed middle section of the frame. The front and fixed middle section are connected to each other by the expendable section of the frame and mounted on the wheelbase. The expendable middle section of the sideboards is rigidly attached to the expendable section of the frame and is installed in the front and fixed sections of the sideboards with the ability to shift axially. A hinged section of the frame, capable of rotating 360 degrees, is attached from the lower right side to the fixed middle section of the frame; the hinged tail section of the sideboards and the tailboard are rigidly attached to this hinged section. The upper right section of the fixed middle section of the sideboards features a locking mechanism designed to secure the hinged tail section of the sideboards to the fixed middle part, whether the tail section is folded or unfolded.
