

Method for disinfecting hives and honeycombs in the spring period involves the use of a disinfectant mixture based on an antimicrobial agent by spraying the inner surface of the hive and honeycombs. Propolis is used as the antimicrobial agent. As a disinfectant mixture, a mixture of 20% alcohol solution of propolis and an organosilicon surfactant trisiloxane polyester in an amount of 0.1 ml/l is used, once, with a consumption rate of 250 ml/sq. m.
