

Reaper for harvesting oil flax contains a platform, a collection auger and an inclined chamber with an attachment. Additionally, reaper is equipped with a frame fitted with hydraulic cylinders, which is connected to the support beams of the rotary cutting sections according to the width of the reaper, some rotors in the rotary cutting sections are drive rotors, while others are driven rotors, and have disc devices with cups, blades, and covers with knives mounted on hinges around the circumference. Wherein, the drive of each rotary cutting section is equipped with a hydraulic motor, furthermore, the driven rotors are made with the possibility of rotation due to the connection of mechanical gears with the driving rotors.
