

Plough body contains a movable landside plate. The landside plate is rigidly fixed in the front part, whilst in the middle and rear parts, in the vertical plane, an active rolling element is mounted on it, consisting of two barrel-shaped rollers of the same size, which rotate about their axis and are interconnected by a belt that follows their profile. Wherein, a wedge-shaped element in the form of a trapezium is made in the center of the belt, which forms a clutch with the rollers and ensures their continuous rotation.
