

Plow body contains a movable landside plate. The landside plate is rigidly mounted in the front part, while from the middle part and closer to the rear there are active rolling elements in the form of rollers, the axis of which lies in a vertical plane. The horizontal axis runs through the center of the landside plate. The dimensions of each roller increase by one and a half times relative to the smallest, and the surface of the rollers is barrel-shaped. The vertical axes of the rollers are located with the same pitch, evenly along the entire length of the landside plate.
