

Kit for treating adipose tissue, bone marrow and preparing enriched microfragmented fat consists of a box containing a filtration system, connecting tubes, and adapters. Wherein, the filtration system is designed as a triple filtration system, the first two filters are made in the form of a first filter bag for the sequential passage of lipoaspirate from top to bottom, the third filter is made in the form of a second filter bag for filtering bone marrow aspirate. The connecting tube between the two filter bags is equipped with a check valve, which allows the contents of the second filter bag to flow into the first filter bag.
