

Method for packaging poppy seed filling—a semi-finished product for bakery and confectionery products—involves wrapping the poppy seed filling in plastic film and then placing it in a rigid rectangular container made of cardboard or corrugated cardboard. Packaging is carried out using a vacuum syringe with volume control. The filling is weighed on an electronic scale, shaped into a sausage-like form, and the ends of the plastic wrap are secured with clips. The back flap of the cardboard box is opened, and the poppy seed filling, shaped like a sausage and wrapped in plastic, is placed inside. A cover with a round opening is placed on top so that the end of the plastic film with the clips fits into the opening, and the cardboard box is closed.
