

Universal body of standard dimension includes a system for attaching to a vehicle, designed to partially cover the space above the vehicle. It comprises a front section, a roof, first and second side sections, and a rear section, which, when joined together, form a frame, with the first and second side sections taking the form of a rectangular frame. The front section is connected to the roof and the first and second side sections, and the rear section is connected to the roof and the first and second side sections. The first side section includes a first side cover hinged on hinges, designed to open and lock in the open position on two gas struts, and a first inner compartment secured to the first side section via a threaded connection. The second side section includes a second side cover hinged on hinges, designed to open and lock in the open position using two gas springs, and a second inner compartment, which is secured to the second side section via a threaded connection. The rear section includes a rear cover designed to open and lock in the open position using two gas springs; the rear section, first side section, and second side section all include seals.
