

Fire extinguishing module for under-hood compartment of passenger car contains a cylinder with a fire extinguishing agent and a manual activation device. An electromagnetic shut-off and start-up valve is installed at the cylinder outlet, the manual activation device is made in the form of a button in the passenger compartment, connected to the vehicle's power supply through a fuse in series with a relay coil. The power contacts of the relay supply power to the electromagnet of the specified valve, and a pipeline with a distribution tee delivers the fire extinguishing agent to at least two nozzles located in the under-hood compartment.
