

Working body for inter-row soil cultivation consists of a duckfoot tine mounted on a rack and wings that are adjustable in height and working width, designed as right- and left-hand razor blades. The wings are mounted on the rack with the ability to adjust their angle of attack relative to the inclination of the ridge. On the rack behind the razor blades right and left rotary tines with an adjustable angle of attack within the range of 30° – 70° are installed.
