

Transformable cuff-necklace jewelry piece comprises an arched hollow component featuring through-holes. Elastic fasteners are installed inside the arched hollow component. Inside the arched hollow component is a flexible element designed to pass through the arched hollow component via the through-holes, where the through-holes are made parallel to the plane of the arched hollow component. The transformable jewelry piece is designed to allow for length adjustment when used as a necklace by changing the position of the flexible element relative to the elastic position retainers.
