

Connecting assembly of modular ankle joint endoprosthesis contains contact elements, one of which has an intramodular stem mounted on it. Wherein, the contact elements of the connecting assembly consist of two adjacent plates made in the form of spherical segments. The distal plate has convex shape, while the proximal plate the shape of a recess that reproduces the convexity of the distal plate. The contact surfaces of both plates are given a high polish, and the intramodular stem is rigidly attached to the dorsal side of the rough surface of the distal plate.
