

Mounting mechanism set for revolving outdoor louvers comprises two symmetrical separate parts – left and right part – where left part includes left support element (1) to which slat holders (6) are mounted with the possibility of rotation, wherein rotatable slat holders (6) are connected to one another by left guide element (5), and right part comprises right support element (2), to which slat holders (6) are fixed with the possibility of rotation, wherein slat holders (6) are connected to one another by right guide element (4). Slat holders (6) have L-shaped cross-section; left support element (1) and right support element (2) are pivotally connected to slat holders (6) by means of the first connector (7). Left guide element (5) and right guide element (4) are connected with slat holders (6) with the possibility of rotation by means of the second connector (8). On left guide element (5) and right guide element (4), semicircular recesses (14) and (15) are formed between the slat holders (6). On the first connector (7), between support elements (1) and (2) and slat holder (6), the first plastic washer (9) is installed, and on the second connector (8) between guide elements (5) and (4) and slat holder (6), the second plastic washer (10) is installed.
