

Modular structure consists of a body and supports on which the body rests; the interior space of the body contains rooms and is equipped in accordance with the functional purpose of the modular structure. There are at least three supports, with utility lines for power supply, water supply, and sewage disposal integrated into them. The body has an opening at the bottom and is equipped with a lifting platform designed to allow the interior space of the modular structure's body to be tightly sealed; this platform is intended for transporting people and cargo into the interior space of the body. A vertical wind turbine system is installed on top of the modular structure's body.
