

The invention relates to computer-implemented methods, devices and a system for accessing a production apparatus (109) by means of a terminal (105) of a user, comprising the steps of: the terminal (105) reading out (201) identification data from a user-specific passive or active transmitting apparatus (104) on which said data are stored; generating (209) a temporal validity; the terminal (105) of the user generating (210) a token (FS), the token (FS) comprising identification information, which is based on the data, and information regarding the temporal validity; a first computing apparatus (102) receiving (212) the token (FS) from a second computing apparatus (108); checking (214) whether a data set matching with respect to the identification information exists in a database (103) and whether the token is within its temporal validity; allowing (215) the access to the production apparatus (109) to be granted by the second computing apparatus (108) if the data set matching with respect to the identification information exists in the database (103) and the token is within its temporal validity, and otherwise prohibiting access from being granted by the second computing apparatus (108).
